/note="Vector: pBluescript SK+; Site_l: EcoRI (5'-end of CDNA); Site_2: XhoI (3'-end of CDNA); Due to a cloning artefact caused by the kit, in most cases the EcoRI site is NOT present, as well as the EcoRIadapter used for cloning. To excise the insert, restriction sites upstream EcoRI should be used (e.g. BamHI, Sali,PStI). NOTE: Also due to the cloning system used Blue/white selection for recombinats is not 100% reliable."

| clone lib="Wheat melotic anther stage was determined by removing anthers from individual primary florets. One anther was sacrificed for microscopic staging, and if determined to be between (and including) melotic stages pre-melosis and metaphase I, the remaining two anthers were collected and pooled for library construction. The tissue, total RNA, and poly(A) RNA were prepared, cDNA synthesised, and directionally ligated into pSPORTI by Tim Sutton in the P Langridge Lab at the Department of Plant Science, University of Adelaide, Waite Campus, Australia. Average insert size 1.5Kb. Plasmid DNA Anderson lab (all other authors)."

The present invention relates to novel polymucleotides encoding integrase (int) and excisionase (xis) and an integrase attachment site (attP) which are isolated from pMLPI, a bacteriophage (lysogenic phage) isolated from Micromonospora carbonacea var. africana. Polymucleotides of the invention are useful for transforming an actinomycete with a vector. They are also useful for creating vectors for site-specific integration into host chromosomes. The integrating vectors are used to express actinomycete genes, manipulate secondary metabolic pathways and create new metabolic products such as hybrid antibiocics. The present sequence is pMLP1 attP site DNA from Micromonospora carbonacea Integrase; int; excisionase; xis; integrase attachment site; pMLP1; site-specific integration; hybrid antibiotic; metabolic product; secondary metabolic pathway; ds. Novel polynucleotides encoding integrase, excisionase and an integrase attachment site isolated from a lysogenic phage pMLP1, useful for transforming an actinomycete. The present invention relates to novel polynucleotides encoding integrase (int) and excisionase (xis) and an integrase attachment site (attp) which are isolated from pMLP1, a bacteriophage (lysogenic phage) isolated from Micromonospora carbonacea var. africana. Polynucleotides of the invention are useful for transforming an actinomycete with a vector. They are also chromosomes. The integrating vectors for site-specific integration into host chromosomes. The integrating vectors are used to express actinomycete genes, manipulate secondary metabolic pathways and create new metabolic products such as hybrid antibiotics. The present sequence is pMLP1 attP/attB right juncture DNA from Micromonospora carbonacea
                                                                                                                                                                                                                                                                                  Integrase, int, excisionase, xis, integrase attachment site, attP, pMLP1, site-specific integration; hybrid antibiotic; metabolic product; attB, secondary metabolic pathway; attB/attP DNA; ds.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Novel polynucleotides encoding integrase, excisionase and an integrase attachment site isolated from a lysogenic phage pMLP1, useful for transforming an actinomycete.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  The sequence encodes 2 integrases which permit site specific integration of a vector into an actinomycete, especially a Micromonospera, genome. The invention relates to nucleic acids and vectors comprising a M. carbonacea everninomicin biosynthetic pathway resistance gene product useful for selecting for a transfected or transformed host cell. An integrative version of the vector is useful for introducing a eventinomicin pathway gene (a bottle-neck gene) into an actinomycete of the genus Micromonospora. The DNA encoding the biosynthetic proteins is useful for synthesising novel everninomicin-related compounds, arising
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      New nucleic acid molecules encoding everninomicin pathway gene products, useful for improving yields of everninomicin, to produce new everninomicin and as probes to identify homologous sequences.

modified orsellinic acid groups contained in everninomicin, for expressing functional or mutant everninomicin biosynthetic enzyme for expressing functional or mutant everninomicin biosynthetic enzyme for explantion, diagnosis and preferably biosynthetis of everninomicins or other secondary metabolic products, improving the yield of everninomicins and to produce novel everninomicins and also as a hybridisation probe to can to produce novel everninomicins and also as a hybridisation probe to combinatorial biosynthesis to generate libraries of orthomycins, e.g. combinatorial biosynthesis to generate libraries of orthomycins, e.g. everninomicin analogues/homologues and drug discovery. The DNA encoding the integrase allows for increasing a given gene dosage. The integrate allows for increasing a given gene dosage. The integrate allows for increasing a given gene dosage. The integrate of choice into chromosomes of different hosts and to integrate genes of choice into chromosomes of different hosts and to integrate genes to vector can also be used to integrate antibiotic resistance genes in order to carry out bioconversions with compounds to which the strain is commanly sensitive and is thus useful in fermentation processes involving e.g. Streptomyces antibioticus. (Updated on 11-SEP-2003 to standardise OS field)

                                                                                                                                                                                                                                                                                                                         ô
                                                                                                                                 The present invention relates to novel polynucleotides encoding integrase (int) and excisionase (xis) and an integrase attachment site (attp) which are isolated from pMLPI. A bacteriophage (lysogenic phage) isolated from Micromonospora carbonacea var. Africana. Polynucleotides of the invention set useful for transforming an actinomycete with a vector. They are also useful for creating vectors for site-specific integration into host chromosomes. The integrating vectors are used to express actinomycete genes, manipulate secondary metabolic pathways and create new metabolic attp?AttB right juncture DNA from Micromonospora halophitica. (Updated on 07-AUG-2003 to correct OS field.)

The present invention relates to novel polynucleotides encoding integrase (int) and exclaionase (xis) and an integrase attachment site (attp) which are isolated from pWLP1, a bacteriophage (lysogenic phage) isolated from Micromonospora carbonacea var. africana. Polynucleotides of the invention are useful for transforming an actinomycete with a vector. They are also chromosomes. The integrating vectors are used to express actinomycete products such as hybrid antibolic pachways and create new metabolic products such as hybrid antibolics. The present sequence is pMLP1 attB DNA from Micromonospora carbonacea
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Integrase, int, excisionase, xis, integrase attachment site, attP; pMLP1; site-specific integration; hybrid antibiotic; metabolic product; attB; secondary metabolic pathway; attB/attP DNA; ds.

                                                                                                                                                                                                                                                                                The present invention relates to novel polymucleotides encoding integrase (int) and excisionase (xis) and an integrase attachment site (attP) which are isolated from MILPI, a bacteriophage (lysogenic phage) isolated from Micromonospora carbonacea var. africana. Polymucleotides of the invention are useful for transforming an actinomycete with a vector. They are also useful for creating vectors for site-specific integration into host chromosomes. The integrating vectors are used to express actinomycete genes, manipulate secondary metabolic pathways and create new metabolic products such as hybrid antiblotics. The present sequence is pMLP1 attB/attP left juncture DNA from Micromonospora carbonacea
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Integrase; int; excisionase; xis; integrase attachment site; patfP; pMLP1; site-specific integration; hybrid antibiotic; metabolic product; attB; secondary metabolic pathway; attB/attP DNA; ds.
                                                                                                                                                                                             Novel polynucleotides encoding integrase, excisionase and an integrase attachment site isolated from a lysogenic phage pMLP1, useful for transforming an actinomycete.

```
The present invention relates to novel polynucleotides encoding integrase (int) and excisionase (xis) and an integrase attachment site (attP) which are isolated from pMLPI, a bacteriophage (lysogenic phage) isolated from Micromonospora carbonacea var. africana. Polynucleotides of the invention are useful for transforming an actinomycete with a vector. They are also useful for creating vectors for site-specific integration into host chromosomes. The integration octors are used to express actinomycete genes, manipulate secondary metabolic pathways and create new metabolic attBAattP left juncture DNA from Micromonospora halphilica. (Updated on 07-AUG-2003 to correct OS field.)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              o;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         The invention relates to an isolated nucleic acid detection reagent capable of detecting 1000 or more genes from Drosophila. The invention iseful in developmental biology and in elucidating cell signalling and cell-cell interactions in higher eukaryotes for the development of insecticides, therapeutics and pharmaceutical drugs. The invention discloses genomic DNA sequences (ABL16176-ABL30511), expressed DNA sequences (ABL01840-ABL16175) and the encoded proteins (ABB57737-ABB77071). The sequence data for this partent did not form part of the printed specification, but was obtained in electronic format directly from WIPO at ftp.wipo.int/pub/published_pct_sequences
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                New isolated nucleic acid detection reagent for detecting 1000 or more genes from Drosophila and for elucidating cell signaling and cell-cell
                                                                                                                                     Drosophila melanogaster expressed polynucleotide SEQ ID NO 30914.
                                                                                                                                                                       Drosophila; developmental biology; cell signalling; insecticide;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Sequence 5546 BP; 1398 A; 1240 C; 1213 G; 1695 T; 0 U; 0 Other;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         The present invention relates to novel polynucleotides encoding integrase (int) and excisionase (xis) and an integrase attachment site (attp) which are isolated from pMLP1, a bacteriophage [1ysogenic phage] isolated from Micromonospora carbonacea var. africana. Polynucleotides of the invention are useful for transforming an actinomycete with a vector. They are also useful for creating vectors for site-specific integration into host chromosomes. The integrating vectors are used to express actinomycete products such as hybrid antibiotics. The present sequence is PMLP1 attB DNA from Micromonospora halophytica. P

and related vectors, proteins and diseases that involve apoptosis, e.g.

The invention relates to a DNA (I) that: (i) (ABZ26077-ABZ26079) encodes any of three splice forms of murine DNasax (II) of 295, 295 and 61 amino acids (ABS604013-ABS60405); (ii) is a 40116 bp genomic sequence (ABZ26080) (i or (iii) encodes a protein (IIa) with the biological properties of (II) and is a fragment or allelic or other variant of (i) or (ii). DNase X cogrates DNA inducing apoptocis, immunogenic DNA complexes inhibiting the immune response in systemic lupus erythematosus and mucus in the lungs of cystic fibrosis patients. (I), vectors containing (I) and the encoded proteins (II), are used to diagnose, prevent or treat diseases associated (with apoptosis, specifically systemic lupus erythematosus, acquired immune deficiency syndrome, cancer, cystic fibrosis and prostatic carrophy. Also (I) and (I) can be used to screen for specific binding carrophy. Also (I) and (I) can be used to screen for specific binding carrophy. Also (I) and (I) can be used to screen for specific binding cleared (particularly inactivated) are used to study the specified diseases and/or to characterise genes and/or for testing potential characterises genes and/or for testing potential control of the invention

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 contraction relates to the safe give of themse, an and lead of casts gone, or fragments thereof as target regions in a nucleic acid probe assay for the detection and identification of prokaryotic and/or cukaryotic organisms. The invention also relates to 38 novel sara cukaryotic organisms. The invention also relates to 38 novel sara compared to probe and probe as target region in chloroplasts and characterial, genus- and species specific sara gene/thanka-directed probes and profession in the same and is also found in chloroplasts and diatoms. It has a dual function both as a tRNA and as a mRNA and is involved in rescuing truncated mRNAs which have lost stop codons. Sara genes and the as a transpect regions in nucleic acid probe assays for the detection, identification, or quantification of a prokaryotic or cukaryotic organism. CDNA transcripts of thank molecules may also be used as a target region in a nucleic acid hybridisation assays. A fragment of the sara gene or a tmRNA molecule corresponding to a region of high homology from the 5' and or the 3' and of the DNA molecule can be used as a target region in a nucleic acid probe assay, while a fragment of the sara gene or a tmRNA molecule corresponding to a region of the mology can be used as a target region to distinguish between specific or distinguishing between living and dead prokaryotic or eukaryotic organisms, and in a multiple probe format for broad scale detection and or distinguishing between living and dead prokaryotic organisms. A fragment of the target regions may be used as the basis of an assay for dentification of prokaryotic or eukaryotic organisms, and in a multiple probe can be linked to a microarray gene or distinguishing between living and dead prokaryotic organisms. A fragment of the target regions may be used to moline and or the the target regions may be used as the basis of an assay of dentification of prokaryotic or eukaryotic organisms. A fragment of the target regions and distinguishing and distinguishing and distinguishing and dista
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             probe
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   efficacy of drug therapies against infectious agents. Target regions may also be used to monitor the viability and level of problotic organisms in the gastrointestinal tract. The methods and nucleic acids and compositions of the invention have applications in medicine, and also in industry (e.g., for assessing bacterial contamination of a foodstuff or an environmental sample) Sequences AAF15443-F15547 represent tmRNAs, or fragments thereof, from a wide variety of organisms

The invention relates to an isolated polynucleotide comprising any one of 38043 cDNA sequences, appearing as ACH12789-ACH50831, whose sequence was determined by the technique of SBH (sequencing by hybridisation). Also included is a purified polypeptide comprising a sequence corresponding to a reading frame of the novel polynucleotide. The nucleic acid sequences are useful in diagnostics as expressed sequence tags (SGT) for identifying expressed genes or for physical mapping of the human genome, in forensics, in assessing biodiversities, or in identifying mutations responsible for genetic disorders and other traits. The nucleotide sequences are also useful as hybridisation probes, as oligomers for PCR, protein, or in generating antisense DNA or RNA. The purified polypeptide is useful for generating antisense DNA or RNA. The purified polypeptide is one of the 38043 isolated obNA/SSI sequences. Note: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic formet directly from 19770 at
                                                                 ó
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      New polynucleotide sequences obtained from various cDNA libraries, useful as hybridization probes, as oligomers for PCR, for chromosome and gene mapping, in the recombinant production of protein, or in generating antisense DNA or RNA.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Human; ss; sequencing by hybridisation; SBH; expressed sequence tag; EST; genome mapping; biodiversity; genetic disorder.

Sequence 1, Application US/09880484D

Patent No. 6632791

GENERAL INFORMATION:
APPLICANT: Light, David
APPLICANT: Nagashima, Mariko
APPLICANT: Machael J

TITLE OF INVENTION: Thrombomodulin Analogs for Pharmaceutical Use
FILE REPERENCE: 51863AUSM1

CURRENT APPLICATION NUMBER: US/09/880,484D

CURRENT FILING DATE: 2001-06-12

PRIOR FILING DATE: 2000-06-21

NUMBER OF SEQ ID NOS: 18

SOFTWARE: Patentin version 3:1

SEQ ID NO 1

(http://www.jax.org/resource/documents/dhares/). The DNA was hydrodynamically sheared by repeated passage through a was hydrodynamically sheared by repeated passage through a 0.005 inch orifice at constant valouity. The sheared DNA was blunt end-repaired with T4 DNA polymerase and T4 polymucleotide kinase. Adaptor oligonucleotides were ligated to the blunt ends in high molar excess. The adaptored DNA was purified and size-selected for a 9.5 to 10.5 kb range using preparative agarcse gel electrophoresis. Vector DNA was prepared from a derivative of pMAD42 (gril #472114|gpl AF12972.1), a copy-number inducible derivative of plasmid R1. The vector was ligated with adaptors complementary to the insert adaptors and purified. The sheared, adaptored mouse DNA was annealed to adaptored vector DNA, and transformed into chemically-competent E. coli Xili0-Gold (Stratagene) cells and selected for ampicillin resistance."                                                                                                                                                                                                                                                                                                                                                                                                                                                           ORIGIN
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 ò
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Laboratory Mouse DNA Resource (http://www.jax.org/resources/documents/dnares/). The DNA was hydrodynamically sheared by repeated passage through a 0.005 inch orifice at constant velocity. The sheared DNA was blunt end-repaired with T4 DNA polymerase and T4 polymorlectide kinase. Adaptor oligonuclectides were ligated to the blunt ends in high molar excess. The adaptored DNA was purified and size-selected for a 9.5 to 10.5 kb range using preparative agarose gel electrophoresis. Vector DNA was prepared from a derivative of pwD42 (gi|4732114|gb|AR129072.1), a copy-number inducible derivative of plasmid R1. The vector was ligated with adaptors complementary to the insert adaptors and purified. The sheared, adaptored mouse DNA was annealed to adaptored vector DNA, and transformed into chemically-competent B. Coli XL10-Gold (Stratagene) cells and selected for ampicillin resistance."

Clones are derived from the bovine BAC library CHORI-240

(http://www.chori.org/Dacpac/boxine240.htm). For BAC library

availability, please contact Pieter de Jong (pdejong@mail.cho.org).

Clones may be purchased from BACPAC Resources

(http://www.chori.org/Dacpac/ordering information.htm). This work

was undertaken as part of the International Bovine BAC Mapping

Consortium (IBBMC) by AgResearch Ltd., New Zealand and The

Institute of Genomic Research (TIGR), USA.
